

Get paid, not played.

Applying for software engineering positions can be a full-time job by itself. Besides looking through listings, polishing your resume and preparing, hopeful job-hunters need to diligently keep track of every open application they've made. With scores of applications every season, this can be quite time consuming.

Tracking Your Applications

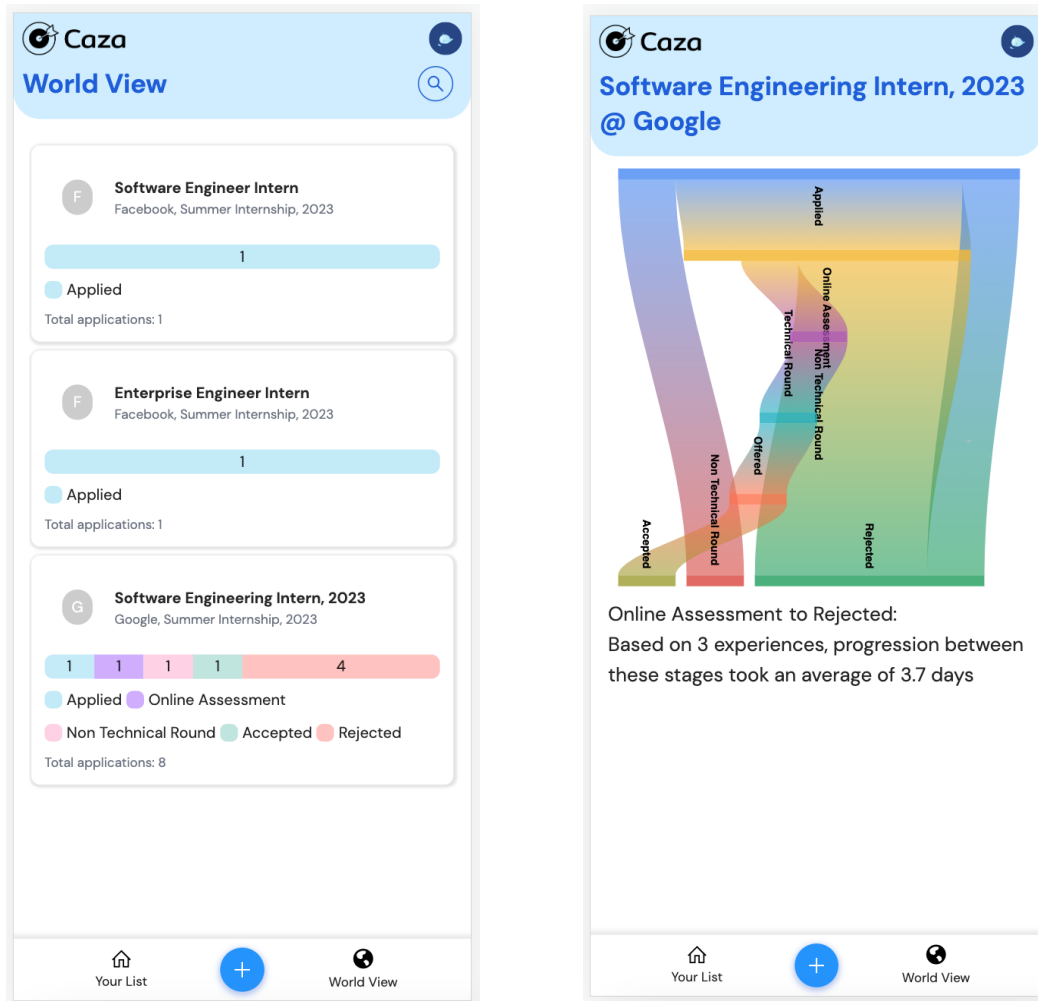

Caza takes away the administrative load and helps applicants focus on what is important. In a few simple steps users can add companies and roles they've applied for, and the stages they've passed. Caza also has support for tasks, remarks and reaction emojis to remind users of things to be done and stages that have gone by.

With our database of applications, Caza can autocomplete most roles and companies and users will not have to fill in anything. If enough users specify a new role or company unknown to the database, Caza will remember it and start including it in the listing.

Real-time Statistics

Caza has an innovative solution to one of the most common questions people have — what is the process like for this role? With crowd sourced data from users, anyone can explore the order, success rates and average time taken for each stage of the interview process. Stop worrying about whether you are getting ghosted.

Upcoming

Caza has the scope to do far more in the future. Here are some of the ideas we have:

- Integrate with other forums and platforms where people discuss roles
- Recommending roles to users, and possibly open a monetization opportunity through referrals
- Ingest more data about the role from web scraping job platforms and posting pages to add geolocation, industry and other useful information

Try it out

If you're currently using Google Sheets, Notion, Notes or any of the typical tools to track your applications, try us out at caza.sivarn.com. Lighten your load and focus on getting hired for the right opportunity.
